WOUND BED PREPARATION: Expectation **VS** Reality

Monday 28th March
13:00 - 13:15

Supported by

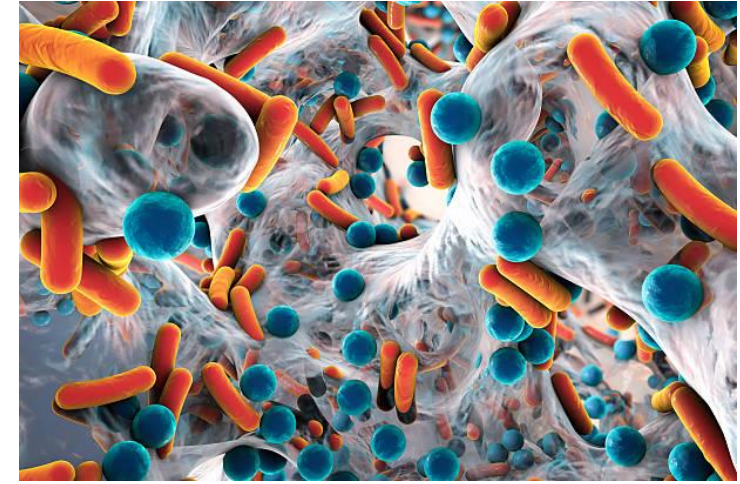

Hard to heal wound management

- Wound bed preparation
- Debridement
- Cleansing
- Biofilm control
- Infection prevention
- Optimal tissue viability

Biofilm actions

- Present in majority of hard to heal wound
- Rapid proliferation
- Can lead to local and spreading infection
- Requires disrupting and dispersion
- Needs early and ongoing maintenance of wound bed prep
- Importance of debridement
- Different debridement options are available

Challenges in wound bed preparation

- Debridement skills
- Changing workforce
- Implementation on 1st wound contact
- Maintenance at every dressing change
- Time in practice
- Education – use across all tissue types
- Product availability

Summary

- We need cost-effective solutions for wound bed preparation
- The message needs to be simple and backed by evidence
- There are excellent technologies available to support us
